# Morbidity and Mortality Weekly

### U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE PUBLIC HEALTH SERVICE

Prepared by the

COMMUNICABLE DISEASE CENTER

634-5131

For release August 15, 1964

ATLANTA, GEORGIA 30333

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED AUGUST 8, 1964 .\_\_\_\_

#### **DIPHTHERIA**

No cases of diphtheria were reported for the week ended August 8. This is the third week this year for which no cases of diphtheria were reported. Thus, the cumulative total for 1964 remains at 160 cases. For the comparable period of 1963, 152 cases were reported. The cumulative cases through the 32nd week and the annual totals for the past 5 years are shown in the accompanying table.

The New England region has reported 43 cases (27 percent of the national total); of these, 39 cases were associated with an outbreak in adults at a State hospital in Maine.

Maine's total is the largest of any State. Texas has reported 21 cases, Georgia 20 cases, thus making theirs the second and third largest State totals.

To date, cases have been reported from 24 States and New York City.

#### EPIDEMIOLOGICAL REPORTS

#### MILKER'S NODULES - Tennessee

On April 15 a 37 year old, white farmer received 8 superficial abrasions on 2 fingers of his right hand while he attempted to introduce 2 sulfa tablets into the mouth of an 8-month-old calf. Only one of the lesions bled. The patient immediately washed his hand under a faucet in the barn and then milked one of his 2 cows. On returning to the house 30 minutes later, he washed the hand again with soap and water. The abrasions crusted over and healed completely within 5 days.

On April 23, the patient noticed a small, red papule appearing in the area of each bite on the index and ring fingers. These uniformly progressed to pea-sized "warts" which became semi-fluid in consistency within 3-4 days; the patient treated himself with merthiolate. On April 28, (13 days after the bite) he noticed a bluish coloration over the surface of each of the non-tender nodules. There was no swelling, erythema, or drainage; systemic symptoms were absent. The fingers became so pruritic that he found it difficult to resist exceptations the lesions.

Because of the persistence of the nodules and the pruritus the patient consulted a physician on April 29. The physician noted that the lesions were all in the same stage and he confirmed the above description. There was no cellulitis or lymphangitis, although the epitrochlear and axillary lymph nodes were moderately enlarged and tender. The patient was treated with 600,000 units of penicillin intramuscularly. On return visit, April 30, the physician incised one of the nodules which contained a small amount of thick, clear fluid. A gram strain revealed a number of single gram positive rods with rounded, blunt ends; anthrax was considered a differential diagnosis. The patient was admitted to a local hospital where a physical examination was unremarkable, with the exception of the lesions on his hand; he was afebrile, his hematocrit was 49 percent, his white blood cell count was 7,000 with a normal differential. Urinalysis was negative. The patient was treated with penicillin and broad spectrum antibiotics.

By May 6, the lesions were approximately 8-10 mm in diameter, and those which had been surgically opened had a red, granulating base with sharp demarcation from the surrounding normal skin. One lesion remained umbilicated with a dull, red center and smooth, rolled edges. It contained no fluid. Sensation was intact in and around the lesions and there was no tenderness. Epitrochlear or axillary nodes were not enlarged. The patient was discharged May 10; the lesions healed completely by May 20.

One of the cultures taken of the incised nodule yielded *Bacillus circulans*; this was believed to be a laboratory contaminant. Scrapings for fungi were negative; virus studies were not performed.

The diagnosis of Milker's nodules was made clinically. Tennessee health officials believe the patient began to experience the symptoms of milker's nodules 8 days after the bite as a result of direct inoculation of virus in the calf's saliva. This type of transmission has been noted previously. <sup>1</sup>

The calf which bit the patient was one of 20 purchased on April 10. This calf and 8 others were transported by open truck 70 miles to his farm that day; the remaining 11 calves were transported the following day. On April 12 the suspect calf appeared listless, are poorly, and was believed to have "shipping fever." The calf was treated with 10 million units of penicillin, 5 grams of streptomycin, and 4 240-gram sulfa capsules for 2 days without benefit of improvement. On April 15, the patient was bitten while trying to administer 2 of these sulfa capsules. Despite additional treatment, the calf expired on April 17. During its terminal course, the calf appeared lethargic, anorectic and experienced diarrhea and respiratory difficulty. The animal was dumped into a secluded, wooded area on the farm; samples of the carcass were negative for Bacillus anthracis.

No lesions were noted in the oral mucosa of the suspect calf or other animals purchased at the same time. No lesions were present on the teats or udder of the patient's one milk cow prior to the biting; none developed thereafter despite the fact that the patient continued to milk his cow when his lesions were active.

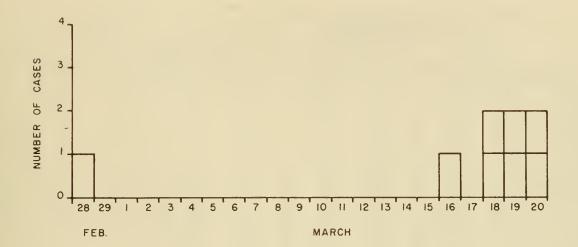

(Reported by Cecil B. Tucker, M.D., Director, Division of Preventable Diseases, Tennessee Department of Public Health, and an EIS Officer.)

Editor's Note: Milker's nodules (pseudocowpox or paravaccinia) is caused by a virus 2.3, recently isolated, which belongs to the pox group, and which is immunologically distinct from cowpox, vaccinia and variola.

#### CAT RABIES - TUCSON, ARIZONA 1964

#### FELINE RABIES - Arizona

Eight cases of cat rabies were reported in Tucson from February 28 to March 20 (See epidemic curve above); 7 occurred within a 4-day period, beginning 17 days after the first case. Most of the cats were strays. Five of the cases occurred in one neighborhood, the remainder in nearby areas. Approximately 6,000 cats were given phenolized rabies vaccine (1,200 in 8 hours in a public clinic) since this outbreak began.

No cases of dog rabies developed. A total of 10 humans were exposed to rabid cats. All received antirabies treatment. No human cases developed.

No source for the cat epidemic could be found. Since the recognition of the cat epidemic, the disease has been confirmed in 3 coyotes, one bobcat, and one bat. Because of the existence of rabies in wild animals, officials speculate that the feline outbreak may have started when a rabid wild animal attacked a cat.

(Reported by Philip M. Hotchkiss, DVM, MPH, Acting Director, Division of Acute Communicable Disease Control, Arizona State Department of Health.)

Editor's Note: This is an unusual outbreak because cat rabies is usually secondary to outbreaks in other hosts.

#### **TUBERCULOSIS**

Reported new active tuberculosis cases and tuberculosis deaths by size of community during 1962 are presented in the tables below. The highest attack rates in both categories occurred in cities with greater than one-half million population. This pattern probably reflects the factor of crowded living conditions in the spread of this disease.

		Tuberculosis Deoths						
AREA*	Number	Rote Per 100,000 Population	Percent					
Cities with 500,000 or more population	2,673	9.3	28.1					
Cities with 250,000 to 500,000 population	751	6.8	7.9					
Cities with 100,000 to 250,000 population	665	5.4	7.0					
Other oreas exclusive of lorge cities	5,417	4.1	57.0					
United States	9,506	5.1	100.0					

	New Active Coses							
AREA*	Number	Rote Per 100,000 Population	Percent					
Cities with 500,000 or more population	16,326	56.0	30.6					
Cities with 250,000 to 500,000 population	4,430	36.9	8.3					
Cities with 100,000 to 250,000 population	4,040	30.6	7.6					
Other areas exclusive of large cities **	28,519	21.7	53.5					
United States	53,315	28.7	100.0					

<sup>\*</sup>Size of cities at time of 1960 census. Includes county data where information was not available separately for principal city,

<sup>\*\*</sup>Includes 672 counties with no new coses reported in 1962.
